

Multi-level lists

Schema: EAC-CPF 2.0

Context: Using multi-level lists in the context of narrative description to convey more complex structures.

Description: Next to allowing for the use of repeated `<item>` elements to create simple lists, the element `<list>` can also be used recursively, i.e. `<list>` can also include another `<list>`. Such multi-level lists can be of help when encoding more complex structures, e.g. a table of content of a person's main publication in `<biogHist>` or in `<generalContext>`, or a family tree or an organizational chart in the context of `<structureOrGenealogy>`. Depending on the use case, there might be `<item>` and `<list>` elements next to each other within `<list>`, e.g. when representing the person being described as an `<item>` and including their children as `<item>`-s within a nested `<list>` on the same level. Especially with multi-level lists, the use of the optional element `<head>` would be recommended to indicate the relation of each nested `<list>` to their parent `<list>` or to the main `<list>` overall.
