Using a local value list to be used in the encoding

Schema: EAC-CPF 2.0

Context: Referencing a locally defined convention or value lists in the encoding.

Description:

Once `<localTypeDeclaration>` has been defined, it can be used via the @localType and @localTypeDeclarationReference attributes. Use @localType to provide the element's type (e.g. type of name or date, type of function), which should come from the convention/list defined in `<localTypeDeclaration>`. Use @localTypeDeclarationReference to refer to the convention/list; the value should match the @id for the convention/list in `<localTypeDeclaration>`.

Examples

```
<nameEntry status="authorized">
  <part localType="https://d-
nb.info/standards/elementset/gnd#personalName"
localTypeDeclarationReference="GNDO">Arendt, Hannah</part>
  <part
localType="https://dnb.info/standards/elementset/gnd#dateOfBirthAndDeath"
localTypeDeclarationReference="GNDO">1906–1975</part>
</nameEntry>
```

```
<function localType="1" localTypeDeclarationReference="ltd1">
  <term>stateAuthority</term>
  <descriptiveNote>
      <p>En textuell beskrivning av organisationens verksamhetssektor</p>
  </descriptiveNote>
</function>
```
